# Laravel Authentication

Prepared By : Mr.Mol Ryna

# What is Authentication?

## Verifying User Identity

Authentication is the process of verifying user identity before granting access to secure areas of an application. It is crucial for maintaining **security and privacy** in digital environments.

# Why Authentication Matters

## Importance of Secure Access

### Protects Sensitive Data

Effective authentication safeguards sensitive user information, ensuring that only authorized individuals can access personal data, thereby protecting against threats such as data breaches and identity theft.

### Prevents Unauthorized Access

By verifying user identities, authentication mechanisms prevent unauthorized access to systems and applications, reducing the risk of malicious activities and maintaining the integrity of critical resources.

### Builds Trust and Reliability

A robust authentication process enhances user confidence in a system, fostering a sense of reliability and safety, which is essential for maintaining user engagement and satisfaction in digital platforms.

# Laravel Authentication Tools

## User Login

Secure user authentication to access web applications effectively.

## User Registration

Simple process for new users to create their accounts securely.

## Password Reset

Built-in tools to retrieve forgotten passwords and ensure security.

# Core Components

## User Model

The User Model represents the users in the database, serving as a crucial component for managing user-related data.

## Guards

Guards define the authentication methods, determining how users are authenticated within the application, ensuring security and access control.

## Providers

Providers are responsible for retrieving users from the database, enabling the application to authenticate users effectively and securely.

## Middleware

Middleware controls route access, ensuring that only authenticated users can access specific routes, thus enhancing the application's security framework.

# Step 1: Install Laravel

## Setting Up Laravel

To start your Laravel journey, use the command line to create a new project. This command initializes a fresh Laravel application ready for authentication development.

# Configure Your Database

## Essential Database Setup

To enable Laravel authentication, ensure you edit the **.env** file by setting DB\_DATABASE to authApp, DB\_USERNAME to root, and leaving DB\_PASSWORD blank.

# Run Migration

## Creating Default Tables

Running the migration command sets up the essential database tables, including users and password resets, streamlining user authentication within your Laravel application.

# Install Authentication Scaffolding

## Setting Up Breeze

To enhance your Laravel application, install Breeze for authentication scaffolding, adding routes, controllers, and views for login and registration functionality swiftly.

# Authentication Routes

## Common Routes Overview

Laravel automatically generates essential authentication routes such as **/login**, **/register**, and **/dashboard**, facilitating seamless user access management in web applications.

# Middleware Protection

## Securing Your Routes

Implementing middleware ensures that only **logged-in users** can access specific routes, enhancing security and protecting sensitive areas of your web application.

# Custom Middleware in Laravel

## Implementing User Role Checks

Creating custom middleware allows you to manage user roles efficiently. Use `php artisan make:middleware CheckRole` for role validation and register in `Kernel.php` to enforce access control.

# Logout Functionality

## Implementing secure logouts

To implement logout functionality, use the route:  
`Route::post('/logout',  
[AuthenticatedSessionController::class, 'destroy'])-  
>middleware('auth')->name('logout');` This ensures  
secure session termination.

# Key Takeaways

01

Laravel Breeze makes setup fast and straightforward for developers.

02

Middleware ensures only authenticated users can access specific routes.

03

Roles and permissions can be easily customized for security needs.

# Example

Config with database first

```
DB_CONNECTION=mysql  
DB_HOST=127.0.0.1  
DB_PORT=3306  
DB_DATABASE=laravelauth  
DB_USERNAME=root  
DB_PASSWORD=
```

# Example

```
1 composer require laravel/breeze --dev
```

```
1 php artisan breeze:install  
2  
3 php artisan migrate
```
